the increasing complexity of work systems and changes in the nature of workplace technology over the past century have resulted in an exponential shift in the nature of work activities from physical labor to cognitive work modern work systems have many characteristics that make them cognitively complex they can be highly interactive comprised of multiple agents and artifacts information may be limited and distributed across space and time task goals are frequently ill defined conflicting dynamic and emergent planning may only be possible at general levels of abstraction or require adaptive solutions some degree of proficiency or expertise is required the stakes are often high and uncertainty time constraints and stress are seldom absent to complicate matters further cognition in complex work settings is typically constrained by broader professional organizational and institutional practice and policy these features of cognitive work present significant challenges to scientific methodology and theory and subsequent design of reliable interventions historically philosophers and scientists have attempted to understand the mental activities experienced during cognitive work at multiple levels of analysis using divergent methods some have examined cognition at an associative contextual functional or holistic level

relying on naturalistic methods to understand the higher mental processes as they work in harmony during goal directed behavior others have embraced experimental methods and favored internal over external validity often reducing cognition to a psychology of fundamental acts such as short term memory access with millisecond shifts in attention more recently macrocognition has evolved as a complementary paradigm macrocognitive researchers have studied the cognitive functions and processes associated with skilled adaptive collaborative and resilient cognitive work in the context of the aforementioned complexities of psychotechnical and sociotechnical work systems typically this research has been carried out using cognitive task analytic techniques that draw on both naturalistic and quasi experimental methods the primary goals of research in macrocognition are to better understand cognitive adaptations to complexity to increase our theoretical understanding of the organism environment relations by studying the mapping between cognitive work and real world demands and to promote use inspired research capable of improving system performance
